There are a lot of tools or S3 clients, for different platforms, but one I really like is 3Hub for Mac.. ProblemI've searched on the internet for MacOS X clients with such features, but they all try to make some kind of hierarchical file system analogy which does not really stick with S3 API.

I would like to be able to download some files, and since the buckets are protected, it needs the HTTP header AWS signature.. Ideally the client would treat the bucket as read-only, to prevent from making mistakes.. ContextI work in a company where we have a cloud-based product that store files on S3.

In their analogy they have the concept of folders where the delimiter is / If a 'folder' contains a lot of keys, then browsing it will either needs to list all the keys, or some clients will list more keys as you scroll down.. Our buckets have millions of files now Sometimes I need to be able to list those buckets and to pick some files to help me debug our application.. Like, traffic off-loading of static files, backup files and data or exchange info, I'm sure there are other uses as well.
